

One replication of the simulation design, 10 years (2,520 days), calibrated on the S&P 500 (X) and gold (Y).
Planted phenomenon: correlation 0.3 on normal days, 0.6 when inflation is high (known with a two-month lag).
States from the 50-day window ending the previous day. Dashed vertical line: 70/30 train/test split. Days beyond the plotted range are marked at the edge.
